                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Best Local Similarity
                                                                                                                                                             The present invention describes a method for determining if an individual has a tumour cell or site of angiogenesis, or if a treatment is effective in changing angiogenesis or changing a status of a set of target cells, comprising angiogenesis or changing a status of a set of target cells, comprising determining if a sample of the subject has an expression product of at least one marker gene. Also described is a compound capable of altering the expression or activity of Keratin 14, TIE 1, Salioadhesin or Siglec in a cell. Peripheral blood mononuclear cell (PBMC)-expressed Keratin 14, TIE 1, Salioadhesin or Siglec, and Kits containing them from the present invention can be used in a diagnostic method, particularly as an indicator of angiogenesis or to determine presence of a tumour cell. The method of the invention is suitable to determine within a few days if a certain treatment against Kaposi's Sarcoma is successful. ABQ81851 to ABQ82006 represent nucleotide sequence used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                 Determining presence of a tumor cell or angiogenesis, and the effectiveness of treatment, by detecting the presence of marker is useful to detect and monitor treatment of Kaposi's Sarcoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ABQ81992 standard;

                                                                                                                                                                                                  á
                                                                                                                                                                                                                                                                                                                                                               CC result in a light hypersensitive phenotype. The gene, wen altered, is C responsible for the light hypersensitive mutant phenotype in Solanum CC lycopersicum (tomato) plants, the phenotype comprising a reduced growth CC of the plant associated with high levels of carotenoids and/or CC chlorophylls and/or flavonoids. Vectors comprising the sequence gene can be used to produce transgenic plants, such as pepper, egyplant, soybean, CC grape, melon, rice, carrot, spinach, citrus, pomaceae or ornamental comprised that contain a tomato TDETI gene. The TDETI mutants are useful con the agro-industrial sector, for generating tomato fruits with high CC carotenoid and/or flavonoid contents. Carotenoids and flavonoids have cantioxidant properties and in addition some flavonoids exhibit cantitumoural properties. They also exhibit a role in plant protection cagainst pathogenic agents and UV light irradiation. Menipulation of the TDETI gene expression can also be used to modify anthocyanin and CC carotenoid content in ornamental species for the achievement of new CC colour variants. Alteration of carotenoid content is useful for improving resistance to Norflurazon herbicides. Further it is possible to combine a content of feath view with mutations such as rin, nor and Nr, which
                                                                                                                                                                                                                                            Matches

Tumour suppressor gene which encodes polypeptide MTG16 active in suppressing cellular function associated with cancer, useful for manufacturing a medicament for treating cancer e.g. adenocarcino adenocarcinoma,

8; Page 67; 125pp; English.

The invention relates to an novel tumour suppressor gene (I) MTG16a or CC MTG16b and encoded polypeptide (II). (I) and (II), or a compound that CC mimics MTG16 activity such as 5-aza-2'-deoxycytidine, are useful for CC manufacturing a medicament for treating cancer, where it reverses DNA CC myeloma, sarcoma, teratocarcinoma, leukaemia, lymphoma, melanoma, CC myeloma, sarcoma, teratocarcinoma, and especially cancer of the breast, CC prostate, liver, ovary, head and neck, neuroectoderm, placenta, skeletal CC muscle, tonsil, lymph tissue, kidney, colon, uterus, testis, stomach, CC adrenal gland, bladder, bone, bone marrow, gall bladder, ganglia, CC gastrointestinal tract, parathyroid, penis, salivary glands, skin, spleen CC synovial membrane, thymus and thyroid gland. (I) and (II) are useful for CC diagnosis of a cancer, or predisposition to cancer, by establishing a CC primers derived from (I). MTG16 is further useful for identifying CC interacting protein suitable as drug targets, where MTG16 is fused to a CC DNA binding domain and used as the bait in a yeast two-hybrid system. CC ABK71964-ABK72041 represent human MTG16 coding sequences and PCR cc primers of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Quantitative PCR analysis was performed using primers (AAT31580-81) to amplify mouse Ich-1, primers (AAT31582-83) to amplify human Ich-1, primers (AAT31584-85) to amplify human interleukin-1 beta converting enzyme (hICE), and control primers (AAT31586-87) for mouse beta-actin. Ich-1 is a new member of the ICE/ced-3 family of cell death genes. Ich-1L (see also AAT31552) and Ich-1S (AAT31553) were amplified simulataneously to produce DNA fragments of 234 and 295 bp, respectively. Expression of Ich-1S was detected in HeLa and Jurkat cells but not in THP.1 or U937 cells. Expression levels of Ich-1L increased in dying hybridoma D011.10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Preventing or promoting programmed cell death in vertebrate cells comprises inhibiting or increasing the activity of interleukin-1-beta converting enzyme, or altering expression of

This invention describes a novel method for the direct identification o organisms (A) in a biological sample which comprises (i) dividing the sample into many parts (B); (ii) immobilizing (A) in (B); (iii) contacting (B) with at least one labeled hybridization probe (HP) and (iv) detecting bound label. Different HP (or combinations of them) are used for each (B) and HP comprise a hybridization region that is complementary to a target sequence, available for hybridization within the cell, in (A)-specific nucleic acid. The method is used to identify (A), i.e. bacteria, fungi, protozoa or multi-cellular parasites, (i) in foods (or pharmaceuticals), for process or quality control and (ii) in
                                                                                                                                                                                                                                                                                                                                                                                                                                             Detection; probe; identification; food; pathogen; tuberculos bacterium; fungus; protozoa; multi-cellular parasite; infect septic shock; necrotizing fasciitis; cystic fibrosis; mening urogenital infection; fulminant endocarditis; ophthalmitis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        with infections that need very quick diagnosis, especially septic shock, necrotizing fasciltis, sepsis, exacerbation of cystic fibrosis, urogenital infections during pregnancy, fulminant endocarditis, meningitis and ophthalmitis, but also for non-fulminant infections, e.g. tuberculosis, that requires quarantining of infected subjects. The method is sensitive, specific, simple (particularly no need for lysis, culturing or microscopy), produces reliable results in typically 3 hr, is relatively inexpensive, and can identify all potential pathogens associated with a particular disease. Compared with known in situ methods, sample sizes may be 10-20 times larger, increasing sensitivity by at least an order of magnitude. The method is suitable for routine use by non-expert personnel, AAH20833-AAH20866 represent probes described in the disciplence of the invariant content of the invariant co
The invention relates to an isolated polypeptide, comprising form of mouse or human SAC1 polypeptide. The variant form is with altered preference for carbohydrates, other sweeteners of the polypeptide and its associated DNA sequence can be produced by the polypeptide and its associated polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         T 67
                                                                                                                                                                                       SAC1 polypeptide, and is associated carbohydrates or other sweeteners,
                                                                                                                                                                                          Novel isolated polypeptide comprising variant form of mouse SAC1 polypeptide, and is associated with altered preference carbohydrates or other sweeteners, useful for preventing obe

Recombinant cell lines and transgenic embryos may be used in screening for and identifying agents that induce or repress function of SAC1. Predisposition to diabetes, obesity or alcoholism can be ascertained by testing any fluid or tissue of a human (such as blood, pancreas or tongue) for sequence variations of the SAC1 gene. A sequence variation of the SAC1 locus may indicate a predisposition to diabetes, obesity and/or alcoholism and may provide a diagnostic mark. The polymucleotide can be detected in a biological sample by contacting the DNA with a probe to form a hybridisation complex sample by contacting the DNA with a probe to form a hybridisation complex
                                       primer P6(4) PTK-specific cDNA was synthesised. amplified using primers P6(4) and N5. A 2097 bp obtained. Primers B3, P12 and E6 were then used the C-terminal of the HEK2 receptor gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              HEK-2
                                                                                                                                              Human embryonal kinase diagnosis and therapy

                                                                                                                                                                                                                                                                                                  protein tyrosine kinase receptor. The gene encoding the receptor i related to the trk proto-oncogene. Antibodies against the encoded polypeptide are useful for diagnosis and for the treatment of tumours. The antibodies may also be radiolabelled or coupled to a cytotoxin for destruction of cancer cells. Antisense nucleic acid can be used to inhibit gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             to abnormal PK activity, and cancer. Human foetal liver polypwas PCR amplified, and the products subcloned, sequenced and to produce the plasmids pLKB1-1 and pLKB1-2. When the coding region of pLKB1-1 was isolated by restriction digest, and and by northern blotting against polyA+ RNA prepared from various human organs and cultured cells, weak expression was detected almost all tissue and cell types.

(Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Homeobox 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is a degenerate PCR primer for protein kinase (PK) cDNA isolation. The PK may be used to treat disorders related to abnormal PK activity, and cancer. Human feetal liver polyA+ RNA

The present sequence represents a specifically claimed oligonucleotide PCR primer. The oligonucleotide can be used for polymerase chain reaction (PCR) amplification of DNA, specifically regions of specific genes that are conserved among mammalian species, i.e. pairs of oligonucleotides from the present specification represent universal mammalian sequence-tagged site (UM-STS) primers. The primers are used to develop genomic maps, to isolate clones from libraries, to make cross-species comparisons and to develop additional genetic markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a specifically claimed oligonucleotide PCR primer. The oligonucleotide can be used for polymerase chain reaction (PCR) amplification of DNA, specifically regions of specific genes that are conserved among mammalian species, i.e. pairs of oligonucleotides from the present specification represent universal mammalian sequence-tagged site (UM-STS) primers. The primers are used to develop genomic maps, to isolate clones from llbraries, to make cross-species comparisons and to develop additional genetic markers. UM-STS allow genomic comparisons to be made between more species.
                                                                                                                                                                                                                                                                                              New oligonuclectide primers amplifying gene regions conserved among mammals - useful for developing genomic maps, isolating clones and making cross-species comparisons
                                                                                                                                                                                                                                              Claim 1; Page 9; 26pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ន្តដ្ឋន
                                     The invention provides a new method for identifying and characterising CC cells. The method for determining the genetic proximity of a first cell cand a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its can be used for determining the origin of a cell, its can individual, e.g. a fetus. They can also be used for determining the ceffect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain can be used for determining the pattern of gene expression in a selected gene family. Sequences AAZ17803-Z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, protein phosphatase genes, P450 mayme genes, steroid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                       The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is
                                                            transformed. They can be used for detecting a selected genetic defect in an individual, e.g. a fetus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences ARZ17803-Z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, expression. The gene family can be selected from a set of homeobox genes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Genetic proximity; gene expression; cell characterisation; homeobox gene; genetic defect; reverse transcriptase polymerase chain reaction; RT-PCR; kinase gene; protein phosphatase; P450; steroid receptor; cadherin;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                  The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for detecting a selected genetic defect in an individual, e.g. a fetus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used for
                                                            obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptuse polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAZ17803-Z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox gene kinase genes, protein phosphatase genes, P450 enzyme genes, steroid receptor superfamily genes or cadherin superfamily genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Genetic proximity; gene expression; cell characterisation; homeobox gene; genetic defect; reverse transcriptase polymerase chain reaction; RT-PCR; transcriptase gene; protein phosphatase; P450; steroid receptor; cadherin;

                                                                                                                                                                                                                The invention provides a new method for identifying and characterising coalls. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of fexpression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its compared to the control of the cell, its compared to the control of the cell, its compared to the control of the cell, its compared to the cell of the cell, its compared to the cell of the cell, its compared to the cell of the ce

                                                                                                                                                                                 CC cell; (b) determining in the first cell and the second cell the pattern CC of expression of genes in a selected gene family; and (c) calculating a CC proximity index using a specified formula. The methods can be used for CC characterising cells, e.g. for determining the origin of a cell, its cell control of the cell; its cell caracteristic cells, whether it carries a genetic defect, or whether it is cell cransformed. They can be used for determining the cells can individual, e.g. a fetus. They can also be used for determining the cells capable of expressing an homeobox related desired containing cells capable of expressing an homeobox related desired corporary. The method uses reverse transcriptses polymerase chain cells can be used for determining the pattern of gene expression in a celected gene family. Sequences AAZ17803-Z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, protein phosphatase genes, P450 enzyme genes, steroid

                                                                                                                                     Ś
                                                                                                                                                                                                                                             The invention provides a new method for identifying and characterising CC cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a compression of genes in a selected gene family; and (c) calculating a compression of genes in a selected gene family; and (c) calculating a compression of a cell, its compression of a cell, its compression in a cell of compression of a cell, its compression in a cell of a selected treatment on a test cell. They can also be used for determining the ceffect of a selected treatment on a test cell. They can also be used for compression cells capable of expressing an homeobox related desired comperty. The method uses reverse transcriptase polymerase chain cell can be used in the RT-PCR reactions to determine the pattern of gene that can be used in the RT-PCR reactions to determine the pattern of gene compression. The gene family can be selected from a set of homeobox genes, kinase genes, protein phosphatase genes, P450 enzyme genes, steroid competer superfamily genes or cadherin superfamily genes.
                                                                                                                                                                            Matches

The method for determining the genetic proximity of a first cell call. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a compositive for expression of genes in a selected gene family; and (c) calculating a compositive for expression of a cell, its compositive for expression and selected genetic defect in an individual, e.g. a fetus. They can also be used for determining the compositive for expressing an homeobox related desired composity. The method uses reverse transcriptase polymerase chain compositive for determining the pattern of gene expression in a compositive for determining the pattern of gene expression in a considered gene family.                                                                                                                                                                                                                                            δ
                                                                                                                                                 AAZ18185
                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention provides a new method for identifying and characterising CC cells. The method for determining the genetic proximity of a first cell cand a second cell comprises: (a) obtaining the first cell and the second cc cell; (b) determining in the first cell and the second ccl the pattern comparison of genes in a selected gene family; and (c) calculating a greatified formula. The methods can be used for comparison of genes in a selected gene family; and (c) calculating a cc proximity index using a specified formula. The methods can be used for cc characterising cells, e.g. for determining the origin of a cell, its cc genetic status, whether it carries a genetic defect, or whether it is cc transformed. They can be used for determining the cc an individual, e.g. a fecus. They can also be used for determining the ceffect of a selected treatment on a test cell. They can also be used for coperty. The method uses reverse transcriptage polymerase chain creation (RT-PCR) for determining the pattern of gene expression in a cc selected gene family. Sequences ARZ17803-Z18342 represent primers that
                                                                                                                                                                                                                                                                              Matches

The method for determining the genetic proximity of a first cell calls. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a CC proximity index using a specified formula. The methods can be used for CC characterising cells, e.g. for determining the origin of a cell, its CC genetic status, whether it carries a genetic defect, or whether it is CC transformed. They can be used for detecting a selected genetic defect in CC transformed. They can be used for detecting a selected genetic defect in cC chainfundual e.g. a fetus. They can also be used for determining the CC obtaining cells capable of expressing an homeobox related desired CC obtaining cells capable of expressing an homeobox related desired CC property. The method uses reverse transcriptase polymerase chain CC can be used in the RT-PCR reactions to determine the pattern of gene expression in a celected gene family. Sequences AAZ17803-Z18342 represent primers that CC can be used in the RT-PCR reactions to determine the pattern of gene cxpression. The gene family can be selected from a set of homeobox genes, CC kinase genes, protein phosphatase genes, P450 enzyme genes, steroid creceptor superfamily genes or cadherin superfamily genes.

                                                                                                                                                                                                                                                                                                                                                                                                                                 멍
                                                                                                                                                                                                                                                                                                                                   S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for detecting a selected genetic defect in an individual, e.g. a fetus. They can also be used for determining the cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain creation (RT-PCR) for determining the pattern of gene expression in a celected gene family. Sequences AAZ17803-Z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, protein phosphatase genes, P450 enzyme genes, steroid
                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                  Query Match

Chlamydia pneumoniae

Synthetic

vaccine; neutralising epitope; PCR primer; ss.

purulent

otitis media;

Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis;

erythema nodosum; pharyngitis;

PCR primer used to amplify an ORF of Chlamydia pneumoniae.

                                                                                                                                                                                                         The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a cells; e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is cransformed. They can be used for determining the origin of a cell, its cell an individual, e.g. a fetus. They can also be used for determining the ceffect of a selected treatment on a test cell. They can also be used for cobtaining cells capable of expressing an homeobox related desired composerty. The method uses reverse transcriptase polymerase chain creation (RT-PCR) for determining the pattern of gene expression in a can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, prefer in homenbarase canes.
                                                                        Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bornchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX3584-AAX35879) can be used in immunogenic compositions as vaccines. Vectors immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.

The sequence represents a splice site within a DNA molecule encoding human PD-ATP-binding cassette (PD-ABC) protein. PD-ABC maps to chromosome 19913 3 and is expressed in various tissues including spleen, thymus, peripheral blood leukocytes, bone marrow and lymph nodes. The PD-ABC DNA molecules and proteins are used to diagnose and treat cardiovascular disorders, inflammatory disorders, dyslipidaemia, epilepsy, diseases related to abnormal calcium flux, coronary artery disease, Tangler's disease, familial high-density lipoprotein deficiency, atherosclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PCR primers AAC62208-09 were used to amplify cDNA encoding flt-4. Flt-4 is a receptor type tyrosine kinase with 7 [g-like domains similar to other VEGF receptors. Flt-4 may play a role in lymphangioenesis. Antisense oligonucleotides can be used for detecting the metastatic potential, diagnosing metastatic prostate cancer or determining the prognosis of a subject with prostate cancer. The method comprises identifying the prostate cell in a body fluid sample and detecting the expression of flt-4 in the cell. Expression of flt-4 in a prostate cell indicates that the cell is a cancerous prostate call that has metastatic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 88
                                                                      modulators of Gene 216 expression and activity. The anti-Gene 216 antibodies and antagonists may also be used to down regulate expression and activity. The anti-Gene 216 antibodies may also be used as diagnostic agents for detecting the presence of Gene 216 proteins in samples (e.g. by enzyme linked immunosorbant assay or ELISA). Disorders that may be prevented, diagnosed and/or treated by the above methods include, for example asthma, obesity and inflammatory bowel disease. The present sequence is that of a Gene 216 related primer used in examples of the invention. The primers are used in the physical mapping of the gene (ABZ72067-ABZ72088), polymorphism (SSCT) analysis (ABZ7201-ABZ72184), sequencing (ABZ72185-ABZ72268) and genotyping (ABZ72317-ABZ72362).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       nucleic acids (or vectors) and proteins may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of gene 216 by expressing inactive proteins or to supplement the patients own production of Gene 216 proteins. Additionally, the nucleic acids may be used to produce the secreted Gene 216 protein, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. The nucleic acids and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples and therefore which patients may be in need of restorative therapy. The Gene 216 protein may also be used as antigens in the production of antibodies against Gene 216 and in assays to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to isolated genes (Gene 216) from human chrome 20p13.p12 and the proteins they encode. The nucleic acids and proteins be used in the prevention, diagnosis and treatment of diseases associated with inappropriate Gene 216 expression. For example, the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; Gene 216; chromosome 20p13-p12; antiasthmatic; anorectic; antiinflammatory; gastrointestinal; gene therapy; vaccine; asthma; obesity; inflammatory bowel disease; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated genes (Gene 216) from human chromosome 20p13-p12 and proteins they encode, useful for the prevention, diagnosis and treatment of asthma, obesity and inflammatory bowel disease -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gene 216 SSCP

CC Single Primer Amplification (SPA). The method comprises synthesising a CC template nucleic acid containing a predetermined sequence and hairpin CC structure with the nested oligonucleotide extension reaction. The method CC is useful for amplifying a nucleic acid, preferably for amplifying a CC family of related nucleic acid sequences to build a complex library of CC polypeptides encoded by the sequences. The engineered nucleic acid strand CC is useful for amplifying a nucleic acid strand by providing a nucleic complex library of CC acid with a predetermined sequence engineered onto its first end, a CC structure between them and contacting the engineered nucleic acid strand CC with a primer containing at least a portion of the predetermined sequence. This process is done in the presence of a polymerase and CC complementary nucleic acid strand. The method of the invention is useful CC complementary nucleic acid strand. The method of the invention is useful CC complementary nucleic acid strand. The method of the invention is useful CC complementary simultaneously more than one different target nucleic acid sequence and for amplifying simultaneously more than one different target nucleic acid complementary to the same or different nucleic acid molecules. This process is done in the presence of a polymerase and cc amplifying simultaneously more than one different target nucleic acid complementary nucleic acid sequence and for amplifying simultaneously more than one different target nucleic acid molecules. This process is accomplementary nucleic acid sequence and for amplifying an uncleic acid sequence and for amplifying simultaneously more than one different target nucleic acid molecules. This
                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 89

문문
                     derived from gag or pol sequences, having one of the sequences fully defined in the specification, and a method for detecting HIV-1 in a biological sample, comprising mixing the sample with two or more of the amplification oligomers that specifically amplify at least one HIV-1 target sequence within gag and a pol sequence which is a protease or reverse transcriptase sequence, amplifying the target, and detecting the amplified product. The oligonucleotides of the invention may be used to diagnose HIV-1 infection. The presents sequence represents a PCR primer used to amplify the HIV-1 protease gene in the HIV detection method of the invention.
                                                                                                                                                             This invention relates to a series of nucleic acid oligomers for amplifying and detecting a nucleotide sequence of human immunodefivirus type 1 (HIV-1). The invention also comprises a labeled oligonucleotide that specifically hybridises to an HIV-1 sequence.
                                                                                                                                                                                                                                                             New nucleic acid oligomers for amplifying a nucleotide sequence from HIV-1 and probes for detecting the amplified product are specific for gag and pol regions and are useful to detect different subtypes of HIV-1 -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HIV; human immunodeficiency virus; ss; primer; gag; nrotease: reverse transcriptase; infection; PCR.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to antisense oligonucleotides targetted to nucleic acids encoding micogen activated protein kinase (MAP)/extracellular signal regulated (ERK) kinase kinase 3 (MEKK3) or a splice variant of MEKK3. MEKK3 is an ubiquitously expressed serine-threonine kinase and activates only the ERK and JNK/SAPK pathways. The antisense compound is useful for inhibiting the expression of MEKK3 and for treating a disease or condition associated with the expression of MEKK3. These may also be used as research reagents and diagnostics, to distinguish between functions of various members of a biological pathway, and in the treatment of a disease or disorder, which can be treated by modulating the matter of the contract of the 
                                    New nucleic acid oligomer, useful for detecting selected regions of gag and pol genes of human immune deficiency virus, particularly for assessing drug resistance -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HIV-1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             the expression of MEKK3. The antisense compounds are further useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation, and as probes or primers. The present sequence is an antisense oligonucleotide targetted towards human MEKK3 cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               modified_base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         modified_base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human

                       This invention relates to a novel isolated nucleic acid, gene 216, identified from human chromosome 20p13-p12. The invention also disclos regions of the 216 gene that contain single nucleotide polymorphisms (SNP's) which may be used as markers for disease susceptibility or severity. The nucleotides of the invention may have antisthmatic, antiinflammatory or anorectic activities and may be used in gene therapy. The nucleic acids, antibodies or its fragments are useful for disgnosing, preventing or treating a disorder, such as respiratory diseases (e.g. asthma, bronchial hyper-responsiveness, chronic obstructive pulmonary disease or adult respiratory distress syndrome), obesity, or inflammatory bowel syndrome. The nucleic acids are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Keith T,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides a number of nucleic acid oligomers which can be used to amplify the gag and pol genes of human immunodeficiency virus type I (HIV-1). These are used to detect regions of the gag and pol genes, especially regions associated with drug resistance, and also for identifying genetic subtypes of the virus. The present sequence is an oligomer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SNP; gene therapy; respiratory disease; asthma; obesity; PCR; bronchial hyper-responsiveness; chronic obstructive pulmonary disease; adult respiratory distress syndrome; inflammatory bowel syndrome.

residues; (ii) a 2'-C-allyl modification at position 4 of the at least ten 2'-O-methyl modifications; and (iv) a 3'-end modifications; and romelysin production the ENA's can inhibit collagenase and stromelysin production

membrane of joints for the treatment or prevention of

arthritis

(iii)

esent invention describes a novel enzymatic nucleic acid (ENA) hammerhead motif (HM) comprising: (i) at least 5 ribose es, (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii tten 2'-O-methyl modifications; and (iv) a 3'-end modification.

The ENA's can also be used to treat antigen presenting cells of a donor to induce tolerance in a recipient to an alloantigen of a donor. They can also be used for enhancing graft tolerance or for treating autoimmune disease, and for treating allorgies and other inflammatory conditions. The ENA's can also be used in diagnosis. Albozyme therapy impacts on the expression of stromelysin without introducing the non-specific effects upon gene expression which accompany treatment with retinoids and dexamethasone. The concentration of ribozyme required to affect a therappeutic treatment is lower than that required of antisense molecules, and is highly specific. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                             rheumatoid arthritis; autoimmune disease; allergy; inflammation; diagnosis; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          *8888888888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a novel enzymatic nucleic acid (ENA) CC having a hammerhead motif (HM) comprising: (i) at least 5 ribose CC residues; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) CC at least ten 2'-O-methyl modifications; and (iv) a 3'-end modification. CC The ENA's can inhibit collagenase and stromelysin production in the CC synovial membrane of joints for the treatment or prevention of arthritis, CC particularly osteoarthritis or rheumatoid arthritis. The ENA's can also be used to treat antigen presenting cells of a donor to induce tolerance CC in a recipient to an alloantigen of a donor. They can also be used for CC enhancing graft tolerance or for treating autoimmune disease, and for CC enhancing graft tolerance or for treating autoimmune disease, and for CC entating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of CC expression which accompany treatment with retinoids and dexamethasone. CC The concentration of ribozyme required to affect a therapeutic treatment is lower than that required of antisense molecules, and is highly concentration of ribozyme required to affect a therapeutic treatment concentration of ribozyme required to affect a therapeutic treatment concentration of ribozyme required to affect a therapeutic treatment concentration of ribozyme required in the exemplification of the concentration of ribozyme required in the exemplification of the concentration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a novel enzymatic nucleic acid (ENA) CC having a hammerhead motif (HM) comprising: (i) at least 5 ribose CC residues; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) CC at least ten 2'-O-methyl modifications; and (iv) a 3'-end modification. CC The ENA's can inhibit collagenase and stromelysin production in the synovial membrane of joints for the treatment or prevention of arthritis, CC particularly osteoarthritis or rheumatoid arthritis. The ENA's can also be used to treat antigen presenting cells of a donor to induce tolerance CC in a recipient to an alloantigen of a donor. They can also be used for treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of Expression which accompany treatment with retinoids and dexamethasone. The concentration of ribozyme required to affect a therapeutic treatment is lower than that required of antisense molecules, and is highly specific. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an CC antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 CC receptor, IGF binding protein [IGFBP]-2 or IGFBP3], which is capable of CC inhibiting or reducing growth factor mediated cell proliferation, CC oligonucleotide which can be used to design the antisense CC oligonucleotide which can be used to design the antisense CC oligonucleotides of the present invention (see AAF45151 and CC oligonucleotides of the present invention (see AAF45151 and CC psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, CC keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the CC skin, a hypermeovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other CC sclerotic disease, kidney disease, hyperproliferation of the inside of the other throat the present of the inside of the other westels or any other hypermediated malignancies, other

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense
                                                                                                                                       Ameliorating the effects of a disorder, e.g. psoriasis, ladministering UV (ultra-violet) treatment (optional) and nucleic acid that inhibits or reduces growth factor media
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               21-JUN-2000; 2000WO-AU00693
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAF52670

The present invention relates to a method for ameliorating the effects

Example

8; Page 84; 201pp; English

exocrine cells. The invention is useful in generating insulin-secreting cells from precursor stem cells or adult pancreatic exocrine cells is useful for generating glucose sensitive insulin secreting beta cells suitable for transplantation, and for in situ development of insulinsecreting cells in a patient. The method is also useful for preventing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP]), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hypernevoascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other scleroid consense, kidney disease, hyperproliferation of the inside of blood morels of the inside of
                                                                       The invention relates to a method for generating insulin-secreting cells from precursor stem cells or adult pancreatic exocrine cells. The method comprises exposing the precursor exocrine cells to: a nucleic acid molecule encoding neurogenin 3 (ngn3) or NeuroD/beta2; or an activator of ngn3 or NeuroD/beta2 gene expression, under conditions effective to generate the insulin-generating cells from the precursor or
                                                                                                                                                                                                                                      Generating insulin-secreting cells from precursor stem cells or adult pancreatic exocrine cells, for generating glucose sensitive insulin secreting beta cells for transplantation, comprises using neurogenin3
                                                                                                                                                                                                                       secreting beta cells or NeuroD/beta2 -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 15

Primers AAV60743-V60745 were used to PCR amplify codons 1-163 of the chuman cyclin-dependent kinase 4 (hCDR4). The amplified product was used to generate a fusion protein comprising part of the hCDR4 sequence linked to codons 154-302 of the yeast PHO85 gene. The fusion protein is used to screen for compounds that affect mammalian cell cycle regulatory proteins. The method comprises administering a compound to a cell line, which contains a reporter gene linked to an Upstream Activation Sequence (UAS) and a promoter, where the UAS binds a transcription control factor (TCF) which is regulated through cyclin-dependent kinase (CDK) phosphorylation. Also included in the construct is an effector gene providing a gene product to permit normal cyclin/CDK regulation of the TCF. Expression of the reporter gene is then analysed in the cell line, thereby determining whether the compound affects the normal regulation. The method can be used to identify inhibitors and activators of mammalian cell cycle regulatory proteins, especially inhibitors and activators of cyclins, CDKs, cyclin/CDK complexes, cyclin kinase inhibitors (CKIs), and cyclin/CDK/CKI complexes. The identified agents can be used for stimulating growth of cells (as in wound healing), or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                                                                      modulate expression of G-alpha-16. G-alpha-16 is a human G protein which interacts differentially with several receptor types including members of the opioid and chemokine receptor families. A series of antisense oligonucleotides have been designed to target different regions of the human G-alpha-16 RNA. They may be used to inhibit the expression of G-alpha-16 in human cells and tissues and thus to treat diseases associated with G-alpha-16, sue he prepared thus to treat diseases, especially cancer. Infections, inflammation or tumour formation can be prevented or delayed. The compounds can be used in research and disgnostics in sandwich and other assays.
                                                                                                                                                                                                                                                                                                                         The
                                                                                                                 Note: The sequence has a phosphorothioate backbone and may be either an oligodeoxymucleotide or a chimeric oligonucleotide containing 2'-methoxyethyl (2'-MB) wings and a deoxy gap. Toumber given above corresponds to the oligodeoxynucleotide s
                                                                                                                                                                                                                                                                                                                                                                                A new antisense compound for inhibiting the expression of human G-alpha-16 and treating, preventing or delaying infections, inflammation or hyperproliferative disorders such as cancer -

                                                                                                                                                                         with inducible nitric oxide synthase, e.g. diabetes, immunological disorder, cardiovascular disorder, neurological disorder or ischaemia/reperfusion injury. The antisense oligonucleotides are also useful for research and diagnostics. The present sequence is that of an antisense 2'-O-methoxyethyl gapmer oligonucleotide with a phosphorothicate backbone, a central "gap" region of ten nucleotides flanked by four nucleotide 2'-MOE (2'-methoxyethyl) wings and 5-methylcytidine residues throughout the oligonucleotide. The antisense oligonucleotide is targeted to human inducible nitric oxide synthase (NOS)
                                                                                                                                                                                                                                                                                                                                                                                                                                          expression of inducible nitric oxide synthase. The antisense compounds have immunomodulator, antidiabetic, cardiovascular, cardiant, neuroprotective, disorder and vasotropic activity. The antisense oligonucleotides are useful for inhibiting the expression of inducible nitric oxide synthase in cells or tissues. In particular, the antisense oligonucleotides are useful for treating diseases or disorders associated with inducible nitric oxide synthase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      modulate expression; immunomodulator; antidiabetic; cardiovascular; cardiant; neuroprotective; vasotropic; ischaemia; reperfusion injury; 2'-O-methoxyethyl; phosphorothioate; human; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to antisense compounds, especially oligonucleotides, which are targeted to a nucleic acid encoding inducible nitric oxide synthase and which specifically hybridise to and modulate expression of inducible nitric oxide synthase. The antisense compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense oligonucleotides for modulating the expression of inducible nitric oxide synthase in cells or tissues, particularly useful for treating e.g. immunological, cardiovascular or neurological disorders, or ischaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bennett CF,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                             targeted to a nucleic acid encoding Her-4 (a receptor/tyrosine kinase) The antisense oligonucleotides are used to inhibit the expression of Her-4 in cells or tissues in vitro. They can be used in diagnostics, therapeutics, prophylaxis and as a probe in research reagents. The antisense oligonucleotides can be used to prevent or delay infection, inflammation or tumour formation. AAH25315-AAH25398 represent antisense oligonucleotides which are received.
                                                                                                                                                                                                                                                                                                                                                 Compound for inhibiting the expression of Her-4 (a receptor/tyrosine kinase) e.g. in preventing tumour formation, comprises an antisense oligonucleotide that hybridizes to a nucleic acid encoding Her-4 -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  modified_base

                                                                                                                                                                                                                                                              Representative examples of ribozyme recognition sites are given in AAAB2415 to AAAB6787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells.
                                                                                                                                                                                                                                                                                              The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent konter than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
                                04-DEC-2000
                                                                                                                                                                                                                    Sequence 19

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDKI, PCNA and Cyclin B1. Representative examples of ribozyme cognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAH57577 to AAH62099 represent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can be used for the state of the contract of the cont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammat. matrix metalloproteinases, growth factors and cell-cycle dependent

Misrl (AAQ49763) is believed to encode an isoform of the rat
MIS receptor. Misr2A/misr2B (AAQ49764), misr3 (AAQ49765) and misr4
(AAQ49766) are believed to encode monomeric isoforms of the rat
inhibin receptor and/or BMP receptor.
